

CHAPTER 25

SCALAR TRIPLE PRODUCT

25.1 INTRODUCTION

Let $\vec{a}, \vec{b}, \vec{c}$ be three vectors. By inserting dot and cross between \vec{a}, \vec{b} and \vec{c} in the same alphabetical order, we introduce the following products:

$$(\vec{a} \cdot \vec{b}) \cdot \vec{c}, (\vec{a} \cdot \vec{b}) \times \vec{c}, (\vec{a} \times \vec{b}) \cdot \vec{c} \text{ and } (\vec{a} \times \vec{b}) \times \vec{c}$$

In the product $(\vec{a} \cdot \vec{b}) \cdot \vec{c}$ we observe that $\vec{a} \cdot \vec{b}$ is a scalar quantity and \vec{c} is a vector and dot product is defined between two vector quantities, therefore the product $(\vec{a} \cdot \vec{b}) \cdot \vec{c}$ is not meaningful. Similarly, the product $(\vec{a} \cdot \vec{b}) \times \vec{c}$ is not meaningful. But, $(\vec{a} \times \vec{b}) \cdot \vec{c}$ is meaningful, because $\vec{a} \times \vec{b}$ is a vector and its dot product with \vec{c} i.e. $(\vec{a} \times \vec{b}) \cdot \vec{c}$ is a scalar quantity. This product is known as the *scalar triple product* of $\vec{a}, \vec{b}, \vec{c}$. The product $(\vec{a} \times \vec{b}) \times \vec{c}$ is also meaningful, because $\vec{a} \times \vec{b}$ is a vector and its cross-product with \vec{c} i.e. $(\vec{a} \times \vec{b}) \times \vec{c}$ is also a vector. This product is known as the *vector triple product* of $\vec{a}, \vec{b}, \vec{c}$.

25.2 SCALAR TRIPLE PRODUCT

DEFINITION Let $\vec{a}, \vec{b}, \vec{c}$ be three vectors. Then the scalar $(\vec{a} \times \vec{b}) \cdot \vec{c}$ is called the scalar triple product of \vec{a}, \vec{b} and \vec{c} and is denoted by $[\vec{a} \vec{b} \vec{c}]$.

Thus, we have $[\vec{a} \vec{b} \vec{c}] = (\vec{a} \times \vec{b}) \cdot \vec{c}$.

GEOMETRICAL INTERPRETATION OF SCALAR TRIPLE PRODUCT Let $\vec{a}, \vec{b}, \vec{c}$ be three vectors.

Consider a parallelepiped having coterminal edges OA, OB and OC such that $\vec{OA} = \vec{a}, \vec{OB} = \vec{b}$ and $\vec{OC} = \vec{c}$. Then, $\vec{a} \times \vec{b}$ is a vector perpendicular to the plane of \vec{a} and \vec{b} as shown in Fig. 25.1. Let ϕ be the angle between \vec{c} and $\vec{a} \times \vec{b}$. If \hat{n} is a unit vector along $\vec{a} \times \vec{b}$, then ϕ is also the angle between \hat{n} and \vec{c} .

Fig. 25.1

Now,

$$\begin{aligned}
 [\vec{a} \vec{b} \vec{c}] &= (\vec{a} \times \vec{b}) \cdot \vec{c} \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the parallelogram } OADB) \hat{n} \cdot \vec{c} \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the parallelogram } OADB) (\hat{n} \cdot \vec{c}) \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the parallelogram } OADB) |\hat{n}| |\vec{c}| \cos \phi \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the parallelogram } OADB) (|\vec{c}| \cos \phi) \quad [\because |\hat{n}| = 1] \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the parallelogram } OADB) (CL) \quad [\because OC \cos \phi = CL] \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= (\text{Area of the base of the parallelopiped}) \times (\text{height}) \\
 \Rightarrow [\vec{a} \vec{b} \vec{c}] &= \text{Volume of the parallelopiped with coterminous edges } \vec{a}, \vec{b}, \vec{c}
 \end{aligned}$$

Thus, the scalar triple product $[\vec{a} \vec{b} \vec{c}]$ represents the volume of the parallelopiped whose coterminous edges $\vec{a}, \vec{b}, \vec{c}$ form a right handed system of vectors.

25.3 PROPERTIES OF SCALAR TRIPLE PRODUCT

PROPERTY I If $\vec{a}, \vec{b}, \vec{c}$ are cyclically permuted the value of scalar triple product remains same.

$$\text{i.e., } (\vec{a} \times \vec{b}) \cdot \vec{c} = (\vec{b} \times \vec{c}) \cdot \vec{a} = (\vec{c} \times \vec{a}) \cdot \vec{b}$$

$$\text{or, } [\vec{a} \vec{b} \vec{c}] = [\vec{b} \vec{c} \vec{a}] = [\vec{c} \vec{a} \vec{b}]$$

PROOF Let $\vec{a}, \vec{b}, \vec{c}$ represent the coterminous edges of a parallelopiped such that they form a right handed system. Then, the volume V of the parallelopiped is given by

$$V = (\vec{a} \times \vec{b}) \cdot \vec{c}$$

Clearly, vectors $\vec{b}, \vec{c}, \vec{a}$ as well as $\vec{c}, \vec{a}, \vec{b}$ form a right handed system of vectors and represent the coterminous edges of the same parallelopiped. Therefore,

$$\therefore V = (\vec{b} \times \vec{c}) \cdot \vec{a} \text{ and } V = (\vec{c} \times \vec{a}) \cdot \vec{b}$$

$$\text{Hence, } (\vec{a} \times \vec{b}) \cdot \vec{c} = (\vec{b} \times \vec{c}) \cdot \vec{a} = (\vec{c} \times \vec{a}) \cdot \vec{b}$$

$$\text{or, } [\vec{a} \vec{b} \vec{c}] = [\vec{b} \vec{c} \vec{a}] = [\vec{c} \vec{a} \vec{b}]$$

Fig. 25.2

PROPERTY II The change of cyclic order of vectors in scalar triple product changes the sign of the scalar triple product but not the magnitude.

$$\text{i.e., } [\vec{a} \vec{b} \vec{c}] = -[\vec{b} \vec{a} \vec{c}] = -[\vec{c} \vec{b} \vec{a}] = -[\vec{a} \vec{c} \vec{b}]$$

PROOF We have,

$$[\vec{a} \vec{b} \vec{c}] = (\vec{a} \times \vec{b}) \cdot \vec{c}$$

$$\Rightarrow [\vec{a} \vec{b} \vec{c}] = -(\vec{b} \times \vec{a}) \cdot \vec{c} \quad [\because \vec{a} \times \vec{b} = -(\vec{b} \times \vec{a})]$$

$$\Rightarrow [\vec{a} \vec{b} \vec{c}] = -\{(\vec{b} \times \vec{a}) \cdot \vec{c}\} = -[\vec{b} \vec{a} \vec{c}] \quad \dots(i)$$

By Property I, we have

$$[\vec{a} \vec{b} \vec{c}] = [\vec{b} \vec{c} \vec{a}]$$

$$\begin{aligned}\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= (\vec{b} \times \vec{c}) \cdot \vec{a} & [\because [\vec{b} \ \vec{c} \ \vec{a}] &= (\vec{b} \times \vec{c}) \cdot \vec{a}] \\ \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= -(\vec{c} \times \vec{b}) \cdot \vec{a} & [\because \vec{b} \times \vec{c} &= -(\vec{c} \times \vec{b})] \\ \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= -\{(\vec{c} \times \vec{b}) \cdot \vec{a}\} = -[\vec{c} \ \vec{b} \ \vec{a}] & \dots(ii)\end{aligned}$$

Again, $[\vec{a} \ \vec{b} \ \vec{c}] = [\vec{b} \ \vec{c} \ \vec{a}] = [\vec{c} \ \vec{a} \ \vec{b}]$

$$\begin{aligned}\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= (\vec{c} \times \vec{a}) \cdot \vec{b} & [\because [\vec{c} \ \vec{a} \ \vec{b}] &= (\vec{c} \times \vec{a}) \cdot \vec{b}] \\ \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= -(\vec{a} \times \vec{c}) \cdot \vec{b} & [\because \vec{c} \times \vec{a} &= -(\vec{a} \times \vec{c})] \\ \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] &= -\{(\vec{a} \times \vec{c}) \cdot \vec{b}\} = -[\vec{a} \ \vec{c} \ \vec{b}] & \dots(iii)\end{aligned}$$

From (i), (ii) and (iii), we obtain

$$[\vec{a} \ \vec{b} \ \vec{c}] = -[\vec{b} \ \vec{a} \ \vec{c}] = -[\vec{c} \ \vec{b} \ \vec{a}] = -[\vec{a} \ \vec{c} \ \vec{b}]$$

PROPERTY III In scalar triple product the positions of dot and cross can be interchanged provided that the cyclic order of the vectors remains same.

i.e., $(\vec{a} \times \vec{b}) \cdot \vec{c} = \vec{a} \cdot (\vec{b} \times \vec{c})$

PROOF We know that

$$[\vec{a} \ \vec{b} \ \vec{c}] = [\vec{b} \ \vec{c} \ \vec{a}]$$

[By Property I]

$$\Rightarrow (\vec{a} \times \vec{b}) \cdot \vec{c} = (\vec{b} \times \vec{c}) \cdot \vec{a}$$

$$\Rightarrow (\vec{a} \times \vec{b}) \cdot \vec{c} = \vec{a} \cdot (\vec{b} \times \vec{c})$$

[Using commutativity of dot product on RHS]

PROPERTY IV The scalar triple product of three vectors is zero if any two of them are equal.

PROOF Let $\vec{a}, \vec{b}, \vec{c}$ be three vectors.

Case I When $\vec{a} = \vec{b}$: In this case,

$$[\vec{a} \ \vec{b} \ \vec{c}] = (\vec{a} \times \vec{b}) \cdot \vec{c} = (\vec{a} \times \vec{a}) \cdot \vec{c} = \vec{0} \cdot \vec{c} = 0 \quad [\because \vec{a} = \vec{b}]$$

Case II When $\vec{b} = \vec{c}$: In this case,

$$[\vec{a} \ \vec{b} \ \vec{c}] = [\vec{b} \ \vec{c} \ \vec{a}]$$

[By Property I]

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = (\vec{b} \times \vec{c}) \cdot \vec{a} = (\vec{b} \times \vec{b}) \cdot \vec{a} = \vec{0} \cdot \vec{a} = 0 \quad [\because \vec{b} = \vec{c}]$$

Case III When $\vec{c} = \vec{a}$: In this case,

$$[\vec{a} \ \vec{b} \ \vec{c}] = [\vec{c} \ \vec{a} \ \vec{b}]$$

[By Property I]

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = (\vec{c} \times \vec{a}) \cdot \vec{b} = (\vec{a} \times \vec{a}) \cdot \vec{b} = \vec{0} \cdot \vec{b} = 0 \quad [\because \vec{c} = \vec{a}]$$

Hence, $[\vec{a} \ \vec{b} \ \vec{c}] = 0$, if $\vec{a} = \vec{b}$ or $\vec{b} = \vec{c}$ or $\vec{c} = \vec{a}$.

PROPERTY V For any three vectors $\vec{a}, \vec{b}, \vec{c}$ and scalar λ , we have

$$[\lambda \vec{a} \ \vec{b} \ \vec{c}] = \lambda [\vec{a} \ \vec{b} \ \vec{c}]$$

PROOF We have,

$$[\lambda \vec{a} \ \vec{b} \ \vec{c}] = (\lambda \vec{a} \times \vec{b}) \cdot \vec{c} = \lambda (\vec{a} \times \vec{b}) \cdot \vec{c}$$

$$[\because \lambda \vec{a} \times \vec{b} = \lambda (\vec{a} \times \vec{b})]$$

$$\Rightarrow [\lambda \vec{a} \ \vec{b} \ \vec{c}] = \lambda [(\vec{a} \times \vec{b}) \cdot \vec{c}] = \lambda [\vec{a} \ \vec{b} \ \vec{c}]$$

PROPERTY VI For any three vectors $\vec{a}, \vec{b}, \vec{c}$ and any three scalars l, m, n

$$[l\vec{a} \ m\vec{b} \ n\vec{c}] = lmn [\vec{a} \ \vec{b} \ \vec{c}]$$

PROOF Using definition of scalar triple product

$$[l\vec{a} \ m\vec{b} \ n\vec{c}] = (l\vec{a} \times m\vec{b}) \cdot n\vec{c} = lm(\vec{a} \times \vec{b}) \cdot n\vec{c} = lmn\{(\vec{a} \times \vec{b}) \cdot \vec{c}\} = lmn[\vec{a} \ \vec{b} \ \vec{c}]$$

PROPERTY VII The scalar triple product of three vectors is zero if any two of them are parallel or collinear.

PROOF Let $\vec{a}, \vec{b}, \vec{c}$ be three vectors such that \vec{a} is parallel or collinear to \vec{b} . Then, $\vec{a} = \lambda \vec{b}$ for some scalar λ .

$$\therefore [\vec{a} \ \vec{b} \ \vec{c}] = [\lambda \vec{b} \ \vec{b} \ \vec{c}] = \lambda [\vec{b} \ \vec{b} \ \vec{c}] = \lambda \times 0 = 0$$

PROPERTY VIII If $\vec{a}, \vec{b}, \vec{c}, \vec{d}$, are four vectors, then $[\vec{a} + \vec{b} \ \vec{c} \ \vec{d}] = [\vec{a} \ \vec{c} \ \vec{d}] + [\vec{b} \ \vec{c} \ \vec{d}]$.

PROOF We have,

$$\begin{aligned} [\vec{a} + \vec{b} \ \vec{c} \ \vec{d}] &= \{(\vec{a} + \vec{b}) \times \vec{c}\} \cdot \vec{d} \\ &= (\vec{a} \times \vec{c} + \vec{b} \times \vec{c}) \cdot \vec{d} && \text{[By distributive law]} \\ &= (\vec{a} \times \vec{c}) \cdot \vec{d} + (\vec{b} \times \vec{c}) \cdot \vec{d} && \text{[By distributive law]} \\ &= [\vec{a} \ \vec{c} \ \vec{d}] + [\vec{b} \ \vec{c} \ \vec{d}] \end{aligned}$$

PROPERTY IX The necessary and sufficient condition for three non-zero, non-collinear vectors $\vec{a}, \vec{b}, \vec{c}$ to be coplanar is that $[\vec{a} \ \vec{b} \ \vec{c}] = 0$.

$$\text{i.e., } \vec{a}, \vec{b}, \vec{c} \text{ are coplanar} \Leftrightarrow [\vec{a} \ \vec{b} \ \vec{c}] = 0$$

PROOF First let $\vec{a}, \vec{b}, \vec{c}$ be three non-zero, non-collinear coplanar vectors. Then, we have to prove that their scalar triple product is zero.

We know that $\vec{a} \times \vec{b}$ is perpendicular to the plane of \vec{a} and \vec{b} and $\vec{a}, \vec{b}, \vec{c}$ are coplanar.

$$\therefore \vec{a} \times \vec{b} \text{ is perpendicular to } \vec{c} \Rightarrow (\vec{a} \times \vec{b}) \cdot \vec{c} = 0 \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = 0$$

$$\text{Thus, } \vec{a}, \vec{b}, \vec{c} \text{ are coplanar} \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = 0$$

Conversely, let $\vec{a}, \vec{b}, \vec{c}$ be three non-zero, non-collinear vectors such that $[\vec{a} \ \vec{b} \ \vec{c}] = 0$. Then, we have to prove that $\vec{a}, \vec{b}, \vec{c}$ are coplanar.

$$\text{Now, } [\vec{a} \ \vec{b} \ \vec{c}] = 0$$

$$\Rightarrow (\vec{a} \times \vec{b}) \cdot \vec{c} = 0$$

$$\Rightarrow \vec{a} \times \vec{b} = \vec{0} \text{ or, } \vec{c} = \vec{0} \text{ or, } (\vec{a} \times \vec{b}) \perp \vec{c}$$

$$\Rightarrow (\vec{a} \times \vec{b}) \perp \vec{c} \quad \left[\because \vec{c} \neq \vec{0} \text{ and } \vec{a} \times \vec{b} \neq \vec{0} \text{ as } \vec{a}, \vec{b} \text{ are non-zero non-collinear vectors} \right]$$

But, $\vec{a} \times \vec{b}$ is a vector perpendicular to the plane of \vec{a} and \vec{b} .

$$\therefore (\vec{a} \times \vec{b}) \perp \vec{c} \Rightarrow \vec{c} \text{ lies in the plane of } \vec{a} \text{ and } \vec{b} \Rightarrow \vec{a}, \vec{b}, \vec{c} \text{ are coplanar vectors}$$

$$\text{Thus, } [\vec{a} \ \vec{b} \ \vec{c}] = 0 \Rightarrow \vec{a}, \vec{b}, \vec{c} \text{ are coplanar vectors.}$$

Hence, $\vec{a}, \vec{b}, \vec{c}$ are coplanar $\Leftrightarrow [\vec{a} \ \vec{b} \ \vec{c}] = 0$

PROPERTY X (Scalar triple product in terms of components) Let $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$, $\vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}$ and $\vec{c} = c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}$ be three vectors. Then,

$$[\vec{a} \ \vec{b} \ \vec{c}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

PROOF We know that

$$\vec{a} \times \vec{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = (a_2 b_3 - a_3 b_2) \hat{i} - (a_1 b_3 - a_3 b_1) \hat{j} + (a_1 b_2 - a_2 b_1) \hat{k}$$

$$\therefore [\vec{a} \ \vec{b} \ \vec{c}] = (\vec{a} \times \vec{b}) \cdot \vec{c}$$

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = \{(a_2 b_3 - a_3 b_2) \hat{i} - (a_1 b_3 - a_3 b_1) \hat{j} + (a_1 b_2 - a_2 b_1) \hat{k}\} \cdot (c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k})$$

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = (a_2 b_3 - a_3 b_2) c_1 - (a_1 b_3 - a_3 b_1) c_2 + (a_1 b_2 - a_2 b_1) c_3$$

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

ILLUSTRATION If $\vec{a} = 2\hat{i} + 3\hat{j} + \hat{k}$, $\vec{b} = \hat{i} - 2\hat{j} + \hat{k}$ and $\vec{c} = -3\hat{i} + \hat{j} + 2\hat{k}$, find $[\vec{a} \ \vec{b} \ \vec{c}]$.

SOLUTION We know that

$$[\vec{a} \ \vec{b} \ \vec{c}] = \begin{vmatrix} 2 & 3 & 1 \\ 1 & -2 & 1 \\ -3 & 1 & 2 \end{vmatrix} = 2(-4-1) - 3(2+3) + 1(1-6) = -10 - 15 - 5 = -30$$

PROPERTY XI (Distributivity of vector product over vector addition) For any three vectors $\vec{a}, \vec{b}, \vec{c}$, we have $\vec{a} \times (\vec{b} + \vec{c}) = \vec{a} \times \vec{b} + \vec{a} \times \vec{c}$.

PROOF Let $\vec{r} = \vec{a} \times (\vec{b} + \vec{c}) - \vec{a} \times \vec{b} - \vec{a} \times \vec{c}$, and let \vec{d} be an arbitrary non-zero vector. Then,

$$\vec{d} \cdot \vec{r} = \vec{d} \cdot [\vec{a} \times (\vec{b} + \vec{c}) - \vec{a} \times \vec{b} - \vec{a} \times \vec{c}]$$

$$\Rightarrow \vec{d} \cdot \vec{r} = \vec{d} \cdot \{\vec{a} \times (\vec{b} + \vec{c})\} - \vec{d} \cdot (\vec{a} \times \vec{b}) - \vec{d} \cdot (\vec{a} \times \vec{c}) \quad \left[\begin{array}{l} \text{By distributivity of dot} \\ \text{product over vector add.} \end{array} \right]$$

$$\Rightarrow \vec{d} \cdot \vec{r} = (\vec{d} \times \vec{a}) \cdot (\vec{b} + \vec{c}) - (\vec{d} \times \vec{a}) \cdot \vec{b} - (\vec{d} \times \vec{a}) \cdot \vec{c} \quad \left[\begin{array}{l} \because \text{In scalar triple product dot} \\ \text{and cross can be interchanged} \end{array} \right]$$

$$\Rightarrow \vec{d} \cdot \vec{r} = (\vec{d} \times \vec{a}) \cdot \vec{b} + (\vec{d} \times \vec{a}) \cdot \vec{c} - (\vec{d} \times \vec{a}) \cdot \vec{b} - (\vec{d} \times \vec{a}) \cdot \vec{c} \quad \left[\begin{array}{l} \text{By distributivity of dot} \\ \text{product over vector add.} \end{array} \right]$$

$$\Rightarrow \vec{d} \cdot \vec{r} = 0$$

Thus, $\vec{d} \cdot \vec{r} = 0 \Rightarrow$ either $\vec{r} = \vec{0}$ or, $\vec{d} \perp \vec{r}$

But, \vec{d} is an arbitrary non-zero vector which is not necessarily perpendicular to \vec{r} .

$$\therefore \vec{r} = \vec{0} \Rightarrow \vec{a} \times (\vec{b} + \vec{c}) - \vec{a} \times \vec{b} - \vec{a} \times \vec{c} = \vec{0} \Rightarrow \vec{a} \times (\vec{b} + \vec{c}) = \vec{a} \times \vec{b} + \vec{a} \times \vec{c}$$

PROPERTY XII If $\vec{a}, \vec{b}, \vec{c}$ are three non-coplanar vectors and $\vec{u}, \vec{v}, \vec{w}$ are three vectors such that

$$\vec{u} = x_1 \vec{a} + y_1 \vec{b} + z_1 \vec{c}, \vec{v} = x_2 \vec{a} + y_2 \vec{b} + z_2 \vec{c} \text{ and } \vec{w} = x_3 \vec{a} + y_3 \vec{b} + z_3 \vec{c}$$

Then, $[\vec{u} \vec{v} \vec{w}] = \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix} [\vec{a} \vec{b} \vec{c}]$

PROOF See Author's book on Objective Mathematics.

ILLUSTRATIVE EXAMPLES

BASED ON BASIC CONCEPTS (BASIC)

Type I ON FINDING THE SCALAR TRIPLE PRODUCT

EXAMPLE 1 Evaluate: $[\hat{i} \hat{j} \hat{k}]$. Also, interpret it geometrically.

SOLUTION We have, $[\hat{i} \hat{j} \hat{k}] = (\hat{i} \times \hat{j}) \cdot \hat{k} = \hat{k} \cdot \hat{k} = 1$

Geometrical interpretation: $[\hat{i} \hat{j} \hat{k}]$ represents the volume of a cube of edge 1 unit whose three coterminal edges are along the coordinate axes. Clearly, volume of such cube is 1 cubic unit.

$$\therefore [\hat{i} \hat{j} \hat{k}] = 1$$

EXAMPLE 2 Evaluate $[\hat{i} \hat{j} \hat{k}] + [\hat{i} \hat{k} \hat{j}]$.

SOLUTION We find that

$$[\hat{i} \hat{j} \hat{k}] + [\hat{i} \hat{k} \hat{j}] = (\hat{i} \times \hat{j}) \cdot \hat{k} + (\hat{i} \times \hat{k}) \cdot \hat{j} = \hat{k} \cdot \hat{k} + (-\hat{j}) \cdot \hat{j} = \hat{k} \cdot \hat{k} - \hat{j} \cdot \hat{j} = 1 - 1 = 0$$

EXAMPLE 3 Find $[\vec{a} \vec{b} \vec{c}]$, when $\vec{a} = 2\hat{i} - 3\hat{j} + 4\hat{k}$, $\vec{b} = \hat{i} + 2\hat{j} - \hat{k}$ and $\vec{c} = 3\hat{i} - \hat{j} + 2\hat{k}$.

SOLUTION We find that

$$[\vec{a} \vec{b} \vec{c}] = \begin{vmatrix} 2 & -3 & 4 \\ 1 & 2 & -1 \\ 3 & -1 & 2 \end{vmatrix} = 2(4-1) - (-3)(2+3) + 4(-1-6) = -7$$

Type II ON FINDING THE VOLUME OF A PARALLELOPIPED WHOSE THREE COTERMINOUS EDGES ARE GIVEN

EXAMPLE 4 Find the volume of a parallelepiped whose edges are given by $-3\hat{i} + 7\hat{j} + 5\hat{k}$, $-5\hat{i} + 7\hat{j} - 3\hat{k}$ and $7\hat{i} - 5\hat{j} - 3\hat{k}$.

SOLUTION Let $\vec{a} = -3\hat{i} + 7\hat{j} + 5\hat{k}$, $\vec{b} = -5\hat{i} + 7\hat{j} - 3\hat{k}$ and $\vec{c} = 7\hat{i} - 5\hat{j} - 3\hat{k}$. We know that the volume of a parallelepiped whose three adjacent edges are $\vec{a}, \vec{b}, \vec{c}$ is equal to $|[\vec{a} \vec{b} \vec{c}]|$. Now,

$$[\vec{a} \vec{b} \vec{c}] = \begin{vmatrix} -3 & 7 & 5 \\ -5 & 7 & -3 \\ 7 & -5 & -3 \end{vmatrix} = -3(-21-15) - 7(15+21) + 5(25-49) = -264$$

\therefore Volume of the parallelepiped $= |[\vec{a} \vec{b} \vec{c}]| = |-264| = 264$ cubic units

Type III ON COPLANARITY OF THREE VECTORS

EXAMPLE 5 Show that the vectors $\vec{a} = -2\hat{i} - 2\hat{j} + 4\hat{k}$, $\vec{b} = -2\hat{i} + 4\hat{j} - 2\hat{k}$ and $\vec{c} = 4\hat{i} - 2\hat{j} - 2\hat{k}$ are coplanar.

SOLUTION We know that three vectors $\vec{a}, \vec{b}, \vec{c}$ are coplanar iff their scalar triple product is zero i.e. $[\vec{a} \vec{b} \vec{c}] = 0$.

$$\text{Here, } [\vec{a} \vec{b} \vec{c}] = \begin{vmatrix} -2 & -2 & 4 \\ -2 & 4 & -2 \\ 4 & -2 & -2 \end{vmatrix} = -2(-8-4) + 2(4+8) + 4(4-16) = 24 + 24 - 48 = 0$$

Hence, the given vectors are coplanar.

EXAMPLE 6 Find λ so that the vectors $\vec{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\vec{b} = \hat{i} + 2\hat{j} - 3\hat{k}$ and $\vec{c} = 3\hat{i} + \lambda\hat{j} + 5\hat{k}$ are coplanar.

SOLUTION We know that vector $\vec{a}, \vec{b}, \vec{c}$ are coplanar iff $[\vec{a} \vec{b} \vec{c}] = 0$. It is given that $\vec{a}, \vec{b}, \vec{c}$ are coplanar

$$\begin{aligned} \therefore [\vec{a} \vec{b} \vec{c}] &= 0 \\ \Rightarrow \begin{vmatrix} 2 & -1 & 1 \\ 1 & 2 & -3 \\ 3 & \lambda & 5 \end{vmatrix} &= 0 \Rightarrow 2(10 + 3\lambda) + 1(5 + 9) + (\lambda - 6) = 0 \Rightarrow 7\lambda + 28 = 0 \Rightarrow \lambda = -4 \end{aligned}$$

EXAMPLE 7 Determine α such that a vector \vec{r} is at right angles to each of the vectors

$$\vec{a} = \alpha\hat{i} + \hat{j} + 3\hat{k}, \vec{b} = 2\hat{i} + \hat{j} - \alpha\hat{k}, \vec{c} = -2\hat{i} + \alpha\hat{j} + 3\hat{k}$$

SOLUTION Since \vec{r} is at right angles to each of the vectors $\vec{a}, \vec{b}, \vec{c}$. Therefore, $\vec{a}, \vec{b}, \vec{c}$ must be coplanar vectors.

$$\begin{aligned} \therefore [\vec{a} \vec{b} \vec{c}] &= 0 \\ \Rightarrow \begin{vmatrix} \alpha & 1 & 3 \\ 2 & 1 & -\alpha \\ -2 & \alpha & 3 \end{vmatrix} &= 0 \Rightarrow \alpha^3 + 11\alpha = 0 \Rightarrow \alpha(\alpha^2 + 11) = 0 \Rightarrow \alpha = 0 \quad [\because \alpha^2 + 11 \neq 0] \end{aligned}$$

Type IV ON COPLANARITY OF FOUR POINTS

EXAMPLE 8 Show that four points whose position vectors are $6\hat{i} - 7\hat{j}$, $16\hat{i} - 29\hat{j} - 4\hat{k}$, $3\hat{j} - 6\hat{k}$, $2\hat{i} + 5\hat{j} + 10\hat{k}$ are coplanar.

SOLUTION Let A, B, C, D be the given points. The given points will be coplanar iff any one of the following triads of vectors are coplanar:

$$\vec{AB}, \vec{AC}, \vec{AD}; \vec{AB}, \vec{BC}, \vec{CD}; \vec{BC}, \vec{BA}, \vec{BD} \text{ etc.}$$

In order to show that $\vec{AB}, \vec{AC}, \vec{AD}$ are coplanar, we will have to show that their scalar triple product i.e. $[\vec{AB} \vec{AC} \vec{AD}] = 0$. Using \vec{PQ} = Position vector Q - Position vector of P, we obtain

$$\vec{AB} = (16\hat{i} - 29\hat{j} - 4\hat{k}) - (6\hat{i} - 7\hat{j}) = 10\hat{i} - 22\hat{j} - 4\hat{k}$$

$$\vec{AC} = (3\hat{j} - 6\hat{k}) - (6\hat{i} - 7\hat{j}) = -6\hat{i} + 10\hat{j} - 6\hat{k}$$

$$\text{and, } \vec{AD} = (2\hat{i} + 5\hat{j} + 10\hat{k}) - (6\hat{i} - 7\hat{j}) = -4\hat{i} + 12\hat{j} + 10\hat{k}$$

$$\therefore [\vec{AB} \vec{AC} \vec{AD}] = \begin{vmatrix} 10 & -22 & -4 \\ -6 & 10 & -6 \\ -4 & 12 & 10 \end{vmatrix} = 10(100 + 72) + 22(-60 - 24) - 4(-72 + 40) = 0$$

Hence, the given points are coplanar.

EXAMPLE 9 Find the value of λ for which the four points with position vector $3\hat{i} - 2\hat{j} - \hat{k}$, $2\hat{i} + 3\hat{j} - 4\hat{k}$, $-\hat{i} + \hat{j} + 2\hat{k}$ and $4\hat{i} + 5\hat{j} + \lambda\hat{k}$ are coplanar.

SOLUTION Let A, B, C, D be the given points. Then,

$$\vec{AB} = (2\hat{i} + 3\hat{j} - 4\hat{k}) - (3\hat{i} - 2\hat{j} - \hat{k}) = -\hat{i} + 5\hat{j} - 3\hat{k}$$

$$\vec{AC} = (-\hat{i} + \hat{j} + 2\hat{k}) - (3\hat{i} - 2\hat{j} - \hat{k}) = -4\hat{i} + 3\hat{j} + 3\hat{k}$$

$$\text{and, } \vec{AD} = (4\hat{i} + 5\hat{j} + \lambda\hat{k}) - (3\hat{i} - 2\hat{j} - \hat{k}) = \hat{i} + 7\hat{j} + (\lambda + 1)\hat{k}$$

The given points are coplanar iff vectors \vec{AB} , \vec{AC} , \vec{AD} are coplanar.

Now, \vec{AB} , \vec{AC} , \vec{AD} are coplanar

$$\Leftrightarrow [\vec{AB} \ \vec{AC} \ \vec{AD}] = 0$$

$$\Leftrightarrow \begin{vmatrix} -1 & 5 & -3 \\ -4 & 3 & 3 \\ 1 & 7 & \lambda + 1 \end{vmatrix} = 0$$

$$\Leftrightarrow -1(3\lambda + 3 - 21) - 5(-4\lambda - 4 - 3) - 3(-28 - 3) = 0$$

$$\Leftrightarrow -3\lambda + 18 + 20\lambda + 35 + 93 = 0 \Leftrightarrow 17\lambda + 146 = 0 \Rightarrow \lambda = \frac{-146}{17}$$

BASED ON LOWER ORDER THINKING SKILLS (LOTS)

Type V ON PROVING RESULTS ON SCALAR TRIPLE PRODUCT

EXAMPLE 10 For any three vectors \vec{a} , \vec{b} , \vec{c} , prove that $[\vec{a} + \vec{b} \ \vec{b} + \vec{c} \ \vec{c} + \vec{a}] = 2[\vec{a} \ \vec{b} \ \vec{c}]$.

SOLUTION We have,

[CBSE 2014]

$$[\vec{a} + \vec{b} \ \vec{b} + \vec{c} \ \vec{c} + \vec{a}]$$

$$= \{(\vec{a} + \vec{b}) \times (\vec{b} + \vec{c})\} \cdot (\vec{c} + \vec{a}) \quad [\text{By definition}]$$

$$= (\vec{a} \times \vec{b} + \vec{a} \times \vec{c} + \vec{b} \times \vec{b} + \vec{b} \times \vec{c}) \cdot (\vec{c} + \vec{a}) \quad [\text{By distributive law}]$$

$$= (\vec{a} \times \vec{b} + \vec{a} \times \vec{c} + \vec{b} \times \vec{c}) \cdot (\vec{c} + \vec{a}) \quad [\because \vec{b} \times \vec{b} = \vec{0}]$$

$$= (\vec{a} \times \vec{b}) \cdot \vec{c} + (\vec{a} \times \vec{b}) \cdot \vec{a} + (\vec{a} \times \vec{c}) \cdot \vec{c} + (\vec{a} \times \vec{c}) \cdot \vec{a} + (\vec{b} \times \vec{c}) \cdot \vec{c} + (\vec{b} \times \vec{c}) \cdot \vec{a} \quad [\text{By distributive law}]$$

$$= [\vec{a} \ \vec{b} \ \vec{c}] + [\vec{a} \ \vec{b} \ \vec{a}] + [\vec{a} \ \vec{c} \ \vec{c}] + [\vec{a} \ \vec{c} \ \vec{a}] + [\vec{b} \ \vec{c} \ \vec{c}] + [\vec{b} \ \vec{c} \ \vec{a}]$$

$$= [\vec{a} \ \vec{b} \ \vec{c}] + [\vec{b} \ \vec{c} \ \vec{a}] \quad [\because \text{Scalar triple product when any two vectors are equal is zero}]$$

$$= 2[\vec{a} \ \vec{b} \ \vec{c}] \quad [\because [\vec{b} \ \vec{c} \ \vec{a}] = [\vec{a} \ \vec{b} \ \vec{c}]]$$

Hence, $[\vec{a} + \vec{b} \ \vec{b} + \vec{c} \ \vec{c} + \vec{a}] = 2[\vec{a} \ \vec{b} \ \vec{c}]$

ALITER We have

$$\begin{aligned} [\vec{a} + \vec{b} \ \vec{b} + \vec{c} \ \vec{c} + \vec{a}] &= \begin{vmatrix} \vec{a} + \vec{b} & \vec{b} + \vec{c} & \vec{c} + \vec{a} \end{vmatrix} \\ &= \begin{vmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{vmatrix} [\vec{a} \ \vec{b} \ \vec{c}] \end{aligned}$$

[By property XII]

$$= \left\{ 1(1-0) - 1(0-1) + 0(0-1) \right\} [\vec{a} \ \vec{b} \ \vec{c}] = 2[\vec{a} \ \vec{b} \ \vec{c}]$$

EXAMPLE 11 Simplify: $[\vec{a} - \vec{b} \ \vec{b} - \vec{c} \ \vec{c} - \vec{a}]$

SOLUTION We have,

$$\begin{aligned} & [\vec{a} - \vec{b} \ \vec{b} - \vec{c} \ \vec{c} - \vec{a}] \\ &= \{(\vec{a} - \vec{b}) \times (\vec{b} - \vec{c})\} \cdot (\vec{c} - \vec{a}) \quad \text{[By definition]} \\ &= (\vec{a} \times \vec{b} - \vec{a} \times \vec{c} - \vec{b} \times \vec{b} + \vec{b} \times \vec{c}) \cdot (\vec{c} - \vec{a}) \quad \text{[By distributive law]} \\ &= (\vec{a} \times \vec{b} + \vec{c} \times \vec{a} + \vec{b} \times \vec{c}) \cdot (\vec{c} - \vec{a}) \quad [\because \vec{b} \times \vec{b} = \vec{0}] \\ &= (\vec{a} \times \vec{b}) \cdot \vec{c} - (\vec{a} \times \vec{b}) \cdot \vec{a} + (\vec{c} \times \vec{a}) \cdot \vec{c} - (\vec{c} \times \vec{a}) \cdot \vec{a} + (\vec{b} \times \vec{c}) \cdot \vec{c} - (\vec{b} \times \vec{c}) \cdot \vec{a} \quad \text{[By distributive law]} \\ &= [\vec{a} \ \vec{b} \ \vec{c}] - [\vec{a} \ \vec{b} \ \vec{a}] + [\vec{c} \ \vec{a} \ \vec{c}] - [\vec{c} \ \vec{a} \ \vec{a}] + [\vec{b} \ \vec{c} \ \vec{c}] - [\vec{b} \ \vec{c} \ \vec{a}] \\ &= [\vec{a} \ \vec{b} \ \vec{c}] - [\vec{b} \ \vec{c} \ \vec{a}] \quad [\because \text{Scalar triple product when any two vectors are equal is zero}] \\ &= [\vec{a} \ \vec{b} \ \vec{c}] - [\vec{a} \ \vec{b} \ \vec{c}] = 0 \quad [\because [\vec{b} \ \vec{c} \ \vec{a}] = [\vec{a} \ \vec{b} \ \vec{c}]] \end{aligned}$$

EXAMPLE 12 Show that vectors $\vec{a}, \vec{b}, \vec{c}$ are coplanar iff $\vec{a} + \vec{b}, \vec{b} + \vec{c}, \vec{c} + \vec{a}$ are coplanar.

[CBSE 2013, 2014, 2016]

SOLUTION $\vec{a}, \vec{b}, \vec{c}$ are coplanar

$$\begin{aligned} \Leftrightarrow & [\vec{a} \ \vec{b} \ \vec{c}] = 0 \\ \Leftrightarrow & 2[\vec{a} \ \vec{b} \ \vec{c}] = 0 \\ \Leftrightarrow & [\vec{a} + \vec{b} \ \vec{b} + \vec{c} \ \vec{c} + \vec{a}] = 0 \quad \text{[See Example 10]} \\ \Leftrightarrow & \vec{a} + \vec{b}, \vec{b} + \vec{c}, \vec{c} + \vec{a} \text{ are coplanar} \end{aligned}$$

EXAMPLE 13 For any three vectors $\vec{a}, \vec{b}, \vec{c}$ show that $\vec{a} - \vec{b}, \vec{b} - \vec{c}, \vec{c} - \vec{a}$ are coplanar.

SOLUTION From Example 11, we have

$$[\vec{a} - \vec{b} \ \vec{b} - \vec{c} \ \vec{c} - \vec{a}] = 0 \Rightarrow \vec{a} - \vec{b}, \vec{b} - \vec{c}, \vec{c} - \vec{a} \text{ are coplanar.}$$

EXAMPLE 14 If the vectors $\vec{\alpha} = a\hat{i} + a\hat{j} + c\hat{k}$, $\vec{\beta} = \hat{i} + \hat{k}$ and $\vec{\gamma} = c\hat{i} + c\hat{j} + b\hat{k}$ are coplanar, then prove that c is the geometric mean of a and b .

SOLUTION If $\vec{\alpha}, \vec{\beta}$ and $\vec{\gamma}$ are coplanar vectors, then

$$\begin{aligned} & [\vec{\alpha} \ \vec{\beta} \ \vec{\gamma}] = 0 \\ \Rightarrow & \begin{vmatrix} a & a & c \\ 1 & 0 & 1 \\ c & c & b \end{vmatrix} = 0 \\ \Rightarrow & a(0-c) - a(b-c) + c(c-0) = 0 \\ \Rightarrow & -ac - ab + ac + c^2 = 0 \Rightarrow c^2 = ab \Rightarrow c \text{ is the geometric mean of } a \text{ and } b. \end{aligned}$$

BASED ON HIGHER ORDER THINKING SKILLS (HOTS)

EXAMPLE 15 For any three vectors $\vec{a}, \vec{b}, \vec{c}$, show that $[\vec{a} \ \vec{b} + \vec{c} \ \vec{a} + \vec{b} + \vec{c}] = 0$.

SOLUTION We have,

$$[\vec{a} \ \vec{b} + \vec{c} \ \vec{a} + \vec{b} + \vec{c}]$$

$$\begin{aligned}
 &= \{\vec{a} \times (\vec{b} + \vec{c})\} \cdot (\vec{a} + \vec{b} + \vec{c}) \\
 &= (\vec{a} \times \vec{b} + \vec{a} \times \vec{c}) \cdot (\vec{a} + \vec{b} + \vec{c}) \\
 &= (\vec{a} \times \vec{b}) \cdot \vec{a} + (\vec{a} \times \vec{b}) \cdot \vec{b} + (\vec{a} \times \vec{b}) \cdot \vec{c} + (\vec{a} \times \vec{c}) \cdot \vec{a} + (\vec{a} \times \vec{c}) \cdot \vec{b} + (\vec{a} \times \vec{c}) \cdot \vec{c} \\
 &= 0 + 0 + [\vec{a} \ \vec{b} \ \vec{c}] + 0 + [\vec{a} \ \vec{c} \ \vec{b}] + 0 = [\vec{a} \ \vec{b} \ \vec{c}] - [\vec{a} \ \vec{b} \ \vec{c}] = 0
 \end{aligned}$$

ALITER 1 Since $\vec{a} + \vec{b} + \vec{c} = \vec{a} + (\vec{b} + \vec{c})$ i.e. $\vec{a} + \vec{b} + \vec{c}$ is expressible as the linear combination of the other two vectors. Therefore, \vec{a} , $\vec{a} + \vec{b}$, $\vec{a} + \vec{b} + \vec{c}$ are coplanar vectors.

Hence, $[\vec{a} \ \vec{a} + \vec{b} \ \vec{a} + \vec{b} + \vec{c}] = 0$

ALITER 2 We have,

$$\begin{aligned}
 [\vec{a} \ \vec{b} + \vec{c} \ \vec{a} + \vec{b} + \vec{c}] &= [\vec{a} + 0\vec{b} + 0\vec{c} \ 0\vec{a} + \vec{b} + \vec{c} \ \vec{a} + \vec{b} + \vec{c}] \\
 &= \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} [\vec{a} \ \vec{b} \ \vec{c}] \quad [\text{By property XII}] \\
 &= 0 \times [\vec{a} \ \vec{b} \ \vec{c}] = 0
 \end{aligned}$$

EXAMPLE 16 Let \vec{a} , \vec{b} , \vec{c} be three non-zero vectors such that \vec{c} is a unit vector perpendicular to both \vec{a} and \vec{b} . If the angle between \vec{a} and \vec{b} is $\pi/6$, prove that $[\vec{a} \ \vec{b} \ \vec{c}]^2 = \frac{1}{4} |\vec{a}|^2 |\vec{b}|^2$.

SOLUTION Since \vec{c} is perpendicular to both \vec{a} and \vec{b} . Therefore, it is parallel to $\vec{a} \times \vec{b}$.
Now,

$$\begin{aligned}
 [\vec{a} \ \vec{b} \ \vec{c}]^2 &= \{(\vec{a} \times \vec{b}) \cdot \vec{c}\}^2 \\
 \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}]^2 &= \left\{ |\vec{a} \times \vec{b}| |\vec{c}| \cos 0^\circ \right\}^2 \quad [\because \vec{c} \parallel (\vec{a} \times \vec{b})] \\
 \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}]^2 &= |\vec{a} \times \vec{b}|^2 |\vec{c}|^2 \\
 \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}]^2 &= \left\{ |\vec{a}| |\vec{b}| \sin \frac{\pi}{6} \right\}^2 \quad \left[\because |\vec{c}| = 1 \text{ and the angle between } \vec{a} \text{ and } \vec{b} \text{ is } \pi/6 \right] \\
 \Rightarrow [\vec{a} \ \vec{b} \ \vec{c}]^2 &= \frac{1}{4} |\vec{a}|^2 |\vec{b}|^2
 \end{aligned}$$

EXAMPLE 17 Prove that: $\vec{a} \cdot (\vec{b} + \vec{c}) \times (\vec{a} + 2\vec{b} + 3\vec{c}) = [\vec{a} \ \vec{b} \ \vec{c}]$.

SOLUTION We have,

$$\begin{aligned}
 &\vec{a} \cdot (\vec{b} + \vec{c}) \times (\vec{a} + 2\vec{b} + 3\vec{c}) \\
 &= \vec{a} \cdot \{(\vec{b} + \vec{c}) \times (\vec{a} + 2\vec{b} + 3\vec{c})\} \\
 &= \vec{a} \cdot \left\{ \vec{b} \times \vec{a} + 2(\vec{b} \times \vec{b}) + 3(\vec{b} \times \vec{c}) + \vec{c} \times \vec{a} + 2(\vec{c} \times \vec{b}) + 3(\vec{c} \times \vec{c}) \right\} \\
 &= \vec{a} \cdot \left\{ \vec{b} \times \vec{a} + 3(\vec{b} \times \vec{c}) + \vec{c} \times \vec{a} - 2(\vec{b} \times \vec{c}) \right\} = \vec{a} \cdot \left\{ -(\vec{a} \times \vec{b}) + \vec{b} \times \vec{c} + \vec{c} \times \vec{a} \right\} \\
 &= -\vec{a} \cdot (\vec{a} \times \vec{b}) + \vec{a} \cdot (\vec{b} \times \vec{c}) + \vec{a} \cdot (\vec{c} \times \vec{a}) = 0 + [\vec{a} \ \vec{b} \ \vec{c}] + 0 = [\vec{a} \ \vec{b} \ \vec{c}]
 \end{aligned}$$

ALITER We have,

$$\begin{aligned}
 & [\vec{a} \quad \vec{b} + \vec{c} \quad \vec{a} + 2\vec{b} + 3\vec{c}] \\
 &= [\vec{a} + 0\vec{b} + 0\vec{c} \quad 0\vec{a} + \vec{b} + \vec{c} \quad \vec{a} + 2\vec{b} + 3\vec{c}] \\
 &= \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 1 & 2 & 3 \end{vmatrix} [\vec{a} \quad \vec{b} \quad \vec{c}] \quad \text{[Using property XII]} \\
 &= (3-2) [\vec{a} \quad \vec{b} \quad \vec{c}] = [\vec{a} \quad \vec{b} \quad \vec{c}]
 \end{aligned}$$

EXAMPLE 18 Let \vec{a} , \vec{b} , \vec{c} be three non-zero vectors. If $\vec{a} \cdot (\vec{b} \times \vec{c}) = 0$ and \vec{b} and \vec{c} are not parallel, then prove that $\vec{a} = \lambda \vec{b} + \mu \vec{c}$, where λ and μ are some scalars.

SOLUTION We have,

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = 0 \Rightarrow \vec{a} \perp \vec{b} \times \vec{c} \quad [\because \vec{a} \neq \vec{0} \text{ and } \vec{b} \times \vec{c} \neq \vec{0}]$$

But, $\vec{b} \times \vec{c}$ is a vector perpendicular to the plane of \vec{b} and \vec{c} .

$$\therefore \vec{a} \perp \vec{b} \times \vec{c}$$

$$\Rightarrow \vec{a} \text{ lies in the plane of } \vec{b} \text{ and } \vec{c}$$

$$\Rightarrow \vec{a} \text{ can be expressed as a linear combination of } \vec{b} \text{ and } \vec{c}$$

$$\Rightarrow \text{There exist scalars } \lambda, \mu \text{ such that } \vec{a} = \lambda \vec{b} + \mu \vec{c}.$$

EXAMPLE 19 If the vectors $\vec{\alpha} = a\hat{i} + \hat{j} + \hat{k}$, $\vec{\beta} = \hat{i} + b\hat{j} + \hat{k}$ and $\vec{\gamma} = \hat{i} + \hat{j} + c\hat{k}$ are coplanar, then prove that $\frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 1$, where $a \neq 1$, $b \neq 1$ and $c \neq 1$.

SOLUTION It is given that $\vec{\alpha}$, $\vec{\beta}$ and $\vec{\gamma}$ are coplanar vectors.

$$\therefore [\vec{\alpha} \quad \vec{\beta} \quad \vec{\gamma}] = 0$$

$$\Rightarrow \begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix} = 0 \Rightarrow abc - a - c + 1 + 1 - b = 0 \Rightarrow abc = a + b + c - 2 \quad \dots(i)$$

$$\begin{aligned}
 \text{Now, } \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} &= \frac{(1-b)(1-c) + (1-c)(1-a) + (1-a)(1-b)}{(1-a)(1-b)(1-c)} \\
 &= \frac{3-2(a+b+c) + (ab+bc+ca)}{1-(a+b+c) + (ab+bc+ca) - abc} \\
 &= \frac{3-2(a+b+c) + (ab+bc+ca)}{1-(a+b+c) + (ab+bc+ca) - (a+b+c-2)} \quad \text{[Using (i)]} \\
 &= \frac{3-2(a+b+c) + ab+bc+ca}{3-2(a+b+c) + ab+bc+ca} = 1
 \end{aligned}$$

EXAMPLE 20 If a is a non-zero real number, then prove that the vectors

$\vec{\alpha} = a\hat{i} + 2a\hat{j} - 3a\hat{k}$, $\vec{\beta} = (2a+1)\hat{i} + (2a+3)\hat{j} + (a+1)\hat{k}$ and $\vec{\gamma} = (3a+5)\hat{i} + (a+5)\hat{j} + (a+2)\hat{k}$ are never coplanar.

SOLUTION We have,

$$[\vec{\alpha} \quad \vec{\beta} \quad \vec{\gamma}] = \begin{vmatrix} a & 2a & -3a \\ 2a+1 & 2a+3 & a+1 \\ 3a+5 & a+5 & a+2 \end{vmatrix}$$

$$\begin{aligned}
 \Rightarrow [\vec{\alpha} \vec{\beta} \vec{\gamma}] &= a \left\{ (2a+3)(a+2) - (a+1)(a+5) \right\} - 2a \left\{ (2a+1)(a+2) - (a+1)(3a+5) \right\} \\
 &\quad - 3a \left\{ (2a+1)(a+5) - (2a+3)(3a+5) \right\} \\
 \Rightarrow [\vec{\alpha} \vec{\beta} \vec{\gamma}] &= a(2a^2 + 7a + 6 - a^2 - 6a - 5) - 2a(2a^2 + 5a + 2 - 3a^2 - 8a - 5) \\
 &\quad - 3a(2a^2 + 11a + 5 - 6a^2 - 19a - 15) \\
 \Rightarrow [\vec{\alpha} \vec{\beta} \vec{\gamma}] &= a(a^2 + a + 1) - 2a(-a^2 - 3a - 3) - 3a(-4a^2 - 8a - 10) \\
 \Rightarrow [\vec{\alpha} \vec{\beta} \vec{\gamma}] &= a(a^2 + a + 1) + a(2a^2 + 6a + 6) + a(12a^2 + 24a + 30) \\
 \Rightarrow [\vec{\alpha} \vec{\beta} \vec{\gamma}] &= a(15a^2 + 31a + 37) = 15a \left\{ \left(a + \frac{31}{30} \right)^2 + \frac{1259}{900} \right\} \neq 0 \text{ for all non-zero } a.
 \end{aligned}$$

Hence, the given vectors are non-coplanar.

EXAMPLE 21 Let \vec{a} , \vec{b} and \vec{c} be non-zero non-coplanar vectors. Prove that:

(i) $\vec{a} - 2\vec{b} + 3\vec{c}$, $-2\vec{a} + 3\vec{b} - 4\vec{c}$ and $\vec{a} - 3\vec{b} + 5\vec{c}$ are coplanar vectors

(ii) $2\vec{a} - \vec{b} + 3\vec{c}$, $\vec{a} + \vec{b} - 2\vec{c}$ and $\vec{a} + \vec{b} - 3\vec{c}$ are non-coplanar vectors.

SOLUTION Since \vec{a} , \vec{b} , \vec{c} are non-zero non-coplanar vectors. Therefore, $[\vec{a} \vec{b} \vec{c}] \neq 0$.

(i) Let $\vec{u} = \vec{a} - 2\vec{b} + 3\vec{c}$, $\vec{v} = -2\vec{a} + 3\vec{b} - 4\vec{c}$ and $\vec{w} = \vec{a} - 3\vec{b} + 5\vec{c}$. Then,

$$\begin{aligned}
 \vec{v} \times \vec{w} &= (-2\vec{a} + 3\vec{b} - 4\vec{c}) \times (\vec{a} - 3\vec{b} + 5\vec{c}) \\
 \Rightarrow \vec{v} \times \vec{w} &= -2(\vec{a} \times \vec{a}) + 6(\vec{a} \times \vec{b}) - 10(\vec{a} \times \vec{c}) + 3(\vec{b} \times \vec{a}) - 9(\vec{b} \times \vec{b}) + 15(\vec{b} \times \vec{c}) \\
 &\quad - 4(\vec{c} \times \vec{a}) + 12(\vec{c} \times \vec{b}) - 20(\vec{c} \times \vec{c}) \\
 \Rightarrow \vec{v} \times \vec{w} &= 6(\vec{a} \times \vec{b}) + 10(\vec{c} \times \vec{a}) - 3(\vec{a} \times \vec{c}) + 15(\vec{b} \times \vec{c}) - 4(\vec{c} \times \vec{a}) - 12(\vec{b} \times \vec{c}) \\
 \Rightarrow \vec{v} \times \vec{w} &= 3(\vec{a} \times \vec{b}) + 3(\vec{b} \times \vec{c}) + 6(\vec{c} \times \vec{a}) \\
 \Rightarrow \vec{v} \times \vec{w} &= 3\{\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + 2(\vec{c} \times \vec{a})\} \\
 \therefore \vec{u} \cdot (\vec{v} \times \vec{w}) &= (\vec{a} - 2\vec{b} + 3\vec{c}) \cdot 3\{\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + 2(\vec{c} \times \vec{a})\} \\
 \Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= 3\left[(\vec{a} - 2\vec{b} + 3\vec{c}) \cdot \{\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + 2(\vec{c} \times \vec{a})\}\right] \\
 \Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= 3\left[(\vec{a} \cdot (\vec{a} \times \vec{b}) + \vec{a} \cdot (\vec{b} \times \vec{c}) + 2\vec{a} \cdot (\vec{c} \times \vec{a}) - 2\vec{b} \cdot (\vec{a} \times \vec{b}) - 2\vec{b} \cdot (\vec{b} \times \vec{c}) \right. \\
 &\quad \left. - 4\vec{b} \cdot (\vec{c} \times \vec{a}) + 3\vec{c} \cdot (\vec{a} \times \vec{b}) + 3\vec{c} \cdot (\vec{b} \times \vec{c}) + 6\vec{c} \cdot (\vec{c} \times \vec{a})\right] \\
 \Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= 3\left[[\vec{a} \vec{b} \vec{c}] - 4[\vec{b} \vec{c} \vec{a}] + 3[\vec{c} \vec{a} \vec{b}]\right] \\
 \Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= 3 \times 0 = 0 \quad \left[\because [\vec{a} \vec{b} \vec{c}] = [\vec{b} \vec{c} \vec{a}] = [\vec{c} \vec{a} \vec{b}] \right] \\
 \Rightarrow [\vec{u} \vec{v} \vec{w}] &= 0
 \end{aligned}$$

Hence, \vec{u} , \vec{v} , \vec{w} are coplanar vectors.

(ii) Let $\vec{u} = 2\vec{a} - \vec{b} + 3\vec{c}$, $\vec{v} = \vec{a} + \vec{b} - 2\vec{c}$ and $\vec{w} = \vec{a} + \vec{b} - 3\vec{c}$. Then,

$$\begin{aligned}\vec{v} \times \vec{w} &= (\vec{a} + \vec{b} - 2\vec{c}) \times (\vec{a} + \vec{b} - 3\vec{c}) \\&= \vec{a} \times \vec{a} + \vec{a} \times \vec{b} - 3(\vec{a} \times \vec{c}) + \vec{b} \times \vec{a} + \vec{b} \times \vec{b} - 3(\vec{b} \times \vec{c}) - 2(\vec{c} \times \vec{a}) - 2(\vec{c} \times \vec{b}) + 6(\vec{c} \times \vec{c}) \\&= \vec{a} \times \vec{b} + 3(\vec{c} \times \vec{a}) - \vec{a} \times \vec{b} - 3(\vec{b} \times \vec{c}) - 2(\vec{c} \times \vec{a}) + 2(\vec{b} \times \vec{c}) \\&= -\vec{b} \times \vec{c} + \vec{c} \times \vec{a} \\\therefore \vec{u} \cdot (\vec{v} \times \vec{w}) &= (2\vec{a} - \vec{b} + 3\vec{c}) \cdot (-\vec{b} \times \vec{c} + \vec{c} \times \vec{a}) \\\Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= -2\vec{a} \cdot (\vec{b} \times \vec{c}) + 2\vec{a} \cdot (\vec{c} \times \vec{a}) + \vec{b} \cdot (\vec{b} \times \vec{c}) - \vec{b} \cdot (\vec{c} \times \vec{a}) \\&\quad - 3\vec{c} \cdot (\vec{b} \times \vec{c}) + 3\vec{c} \cdot (\vec{c} \times \vec{a}) \\\Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= -2[\vec{a} \ \vec{b} \ \vec{c}] - [\vec{b} \ \vec{c} \ \vec{a}] \\\Rightarrow \vec{u} \cdot (\vec{v} \times \vec{w}) &= -3[\vec{a} \ \vec{b} \ \vec{c}] \neq 0 \quad [\because [\vec{a} \ \vec{b} \ \vec{c}] \neq 0] \\\Rightarrow [\vec{u} \ \vec{v} \ \vec{w}] &\neq 0\end{aligned}$$

Hence, \vec{u} , \vec{v} , \vec{w} are non-coplanar vectors.

ALITER (i) Let $\vec{u} = \vec{a} - 2\vec{b} + 3\vec{c}$, $\vec{v} = -2\vec{a} + 3\vec{b} - 4\vec{c}$ and $\vec{w} = \vec{a} - 3\vec{b} + 5\vec{c}$. Then,

$$\begin{aligned}[\vec{u} \ \vec{v} \ \vec{w}] &= \begin{vmatrix} 1 & -2 & 3 \\ -2 & 3 & -4 \\ 1 & -3 & 5 \end{vmatrix} [\vec{a} \ \vec{b} \ \vec{c}] \\\Rightarrow [\vec{u} \ \vec{v} \ \vec{w}] &= [1(15 - 12) + 2(-10 + 4) + 3(6 - 3)] [\vec{a} \ \vec{b} \ \vec{c}] = 0 \times [\vec{a} \ \vec{b} \ \vec{c}] = 0\end{aligned}$$

Hence, \vec{u} , \vec{v} , \vec{w} are coplanar vectors.

(ii) Let $\vec{u} = 2\vec{a} - \vec{b} + 3\vec{c}$, $\vec{v} = \vec{a} + \vec{b} - 2\vec{c}$ and $\vec{w} = \vec{a} + \vec{b} - 3\vec{c}$. Then,

$$\begin{aligned}[\vec{u} \ \vec{v} \ \vec{w}] &= \begin{vmatrix} 2 & -1 & 3 \\ 1 & 1 & -2 \\ 1 & 1 & -3 \end{vmatrix} [\vec{a} \ \vec{b} \ \vec{c}] \\\Rightarrow [\vec{u} \ \vec{v} \ \vec{w}] &= [2(-3 + 2) + 1(-3 + 2) + 3(1 - 1)] [\vec{a} \ \vec{b} \ \vec{c}] \\\Rightarrow [\vec{u} \ \vec{v} \ \vec{w}] &= -3[\vec{a} \ \vec{b} \ \vec{c}] \neq 0 \quad [\because [\vec{a} \ \vec{b} \ \vec{c}] \neq 0] \\\Rightarrow \vec{u}, \vec{v}, \vec{w} &\text{ are non-coplanar vectors.}\end{aligned}$$

EXAMPLE 22 If \vec{a} , \vec{b} , \vec{c} are three non-coplanar vectors, prove that

$$\begin{vmatrix} \vec{a} + \vec{b} + \vec{c} & \vec{a} + \vec{b} & \vec{a} + \vec{c} \end{vmatrix} = -[\vec{a} \ \vec{b} \ \vec{c}]$$

SOLUTION Using property XII, we have

$$\begin{aligned}[\vec{a} + \vec{b} + \vec{c} \ \vec{a} + \vec{b} \ \vec{a} + \vec{c}] &= \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{vmatrix} [\vec{a} \ \vec{b} \ \vec{c}] \\&= \{1 \times (1 - 0) - 1 \times (1 - 0) + 1 \times (0 - 1)\} [\vec{a} \ \vec{b} \ \vec{c}] \\&= (1 - 1 - 1) [\vec{a} \ \vec{b} \ \vec{c}] = -[\vec{a} \ \vec{b} \ \vec{c}]\end{aligned}$$

EXAMPLE 23 Find the altitude of a parallelopiped determined by the vectors \vec{a} , \vec{b} and \vec{c} , if the base is taken as the parallelogram determined by \vec{a} and \vec{b} , and if $\vec{a} = \hat{i} + \hat{j} + \hat{k}$, $\vec{b} = 2\hat{i} + 4\hat{j} - \hat{k}$ and $\vec{c} = \hat{i} + \hat{j} + 3\hat{k}$.

SOLUTION Let V be the volume of the parallelopiped determined by the vectors \vec{a} , \vec{b} and \vec{c} . Then,

$$V = [\vec{a} \ \vec{b} \ \vec{c}] = \begin{vmatrix} 1 & 1 & 1 \\ 2 & 4 & -1 \\ 1 & 1 & 3 \end{vmatrix} = (12 + 1) - (6 + 1) + (2 - 4) = 4 \text{ cubic units.} \quad \dots(i)$$

Let A be the area of the base of the parallelopiped. Then, $A = |\vec{a} \times \vec{b}|$

Now,

$$\vec{a} \times \vec{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & 1 \\ 2 & 4 & -1 \end{vmatrix} = -5\hat{i} + 3\hat{j} + 2\hat{k} \Rightarrow A = |\vec{a} \times \vec{b}| = \sqrt{25 + 9 + 4} = \sqrt{38}$$

We know that: Volume of the parallelopiped = Area of the base \times Altitude

$$\text{i.e. } V = A \times \text{Altitude} \Rightarrow \text{Altitude} = \frac{V}{A} = \frac{4}{\sqrt{38}} \text{ units}$$

EXAMPLE 24 What can you conclude about four non-zero vectors \vec{a} , \vec{b} , \vec{c} and \vec{d} , given that $|(\vec{a} \times \vec{b}) \cdot \vec{c}| + |(\vec{b} \times \vec{c}) \cdot \vec{d}| = 0$

SOLUTION We have,

$$|(\vec{a} \times \vec{b}) \cdot \vec{c}| + |(\vec{b} \times \vec{c}) \cdot \vec{d}| = 0$$

$$\Rightarrow |[\vec{a} \ \vec{b} \ \vec{c}]| + |[\vec{b} \ \vec{c} \ \vec{d}]| = 0$$

$$\Rightarrow [\vec{a} \ \vec{b} \ \vec{c}] = 0 \text{ and } [\vec{b} \ \vec{c} \ \vec{d}] = 0 \quad [\because |x| + |y| = 0 \Leftrightarrow x = 0, y = 0]$$

$$\Rightarrow \vec{a}, \vec{b}, \vec{c} \text{ and } \vec{b}, \vec{c}, \vec{d} \text{ are coplanar triads of vectors.}$$

$$\Rightarrow \vec{a}, \vec{b}, \vec{c}, \vec{d} \text{ are coplanar vectors.}$$

EXAMPLE 25 If $\begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix} = 0$ and the vectors $\vec{A} = \hat{i} + a\hat{j} + a^2\hat{k}$, $\vec{B} = \hat{i} + b\hat{j} + b^2\hat{k}$,

$\vec{C} = \hat{i} + c\hat{j} + c^2\hat{k}$ are non-coplanar, then prove that $abc = -1$.

SOLUTION It is given that $\vec{A}, \vec{B}, \vec{C}$ are non-coplanar vectors.

$$\therefore [\vec{A} \ \vec{B} \ \vec{C}] \neq 0 \Rightarrow \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} \neq 0 \quad \dots(i)$$

$$\text{Now, } \begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix} + \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix} = 0$$

$$\Rightarrow - \begin{vmatrix} a & 1 & a^2 \\ b & 1 & b^2 \\ c & 1 & c^2 \end{vmatrix} + abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0 \quad \left[\text{Applying } C_2 \leftrightarrow C_3 \text{ in 1st det. and taking } a, b, c \right]$$

[common from C_1, C_2, C_3 of 2nd det.]

$$\Rightarrow \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} + abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0 \quad [\text{Applying } C_2 \leftrightarrow C_1 \text{ in first determinant}]$$

$$\Rightarrow (1+abc) \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0$$

$$\Rightarrow (1+abc) [\vec{A} \ \vec{B} \ \vec{C}] = 0 \quad [\text{Using (i)}]$$

$$\Rightarrow 1+abc = 0 \Rightarrow abc = -1 \quad [\because [\vec{A} \ \vec{B} \ \vec{C}] \neq 0]$$

EXERCISE 25.1**BASIC**

1. Evaluate the following:

$$(i) [\hat{i} \ \hat{j} \ \hat{k}] + [\hat{j} \ \hat{k} \ \hat{i}] + [\hat{k} \ \hat{i} \ \hat{j}] \quad (ii) [2\hat{i} \ \hat{j} \ \hat{k}] + [\hat{i} \ \hat{k} \ \hat{j}] + [\hat{k} \ \hat{j} \ 2\hat{i}]$$

2. Find $[\vec{a} \ \vec{b} \ \vec{c}]$, when

$$(i) \vec{a} = 2\hat{i} - 3\hat{j}, \vec{b} = \hat{i} + \hat{j} - \hat{k} \text{ and } \vec{c} = 3\hat{i} - \hat{k}$$

$$(ii) \vec{a} = \hat{i} - 2\hat{j} + 3\hat{k}, \vec{b} = 2\hat{i} + \hat{j} - \hat{k} \text{ and } \vec{c} = \hat{j} + \hat{k}$$

$$(iii) \vec{a} = 2\hat{i} + 3\hat{j} + \hat{k}, \vec{b} = \hat{i} - 2\hat{j} + \hat{k} \text{ and } \vec{c} = -3\hat{i} + \hat{j} + 2\hat{k}$$

[CBSE 2019]

3. Find the volume of the parallelepiped whose coterminal edges are represented by the vectors:

$$(i) \vec{a} = 2\hat{i} + 3\hat{j} + 4\hat{k}, \vec{b} = \hat{i} + 2\hat{j} - \hat{k}, \vec{c} = 3\hat{i} - \hat{j} + 2\hat{k}$$

$$(ii) \vec{a} = 2\hat{i} - 3\hat{j} + 4\hat{k}, \vec{b} = \hat{i} + 2\hat{j} - \hat{k}, \vec{c} = 3\hat{i} - \hat{j} - 2\hat{k}$$

$$(iii) \vec{a} = 11\hat{i}, \vec{b} = 2\hat{j}, \vec{c} = 13\hat{k}$$

$$(iv) \vec{a} = \hat{i} + \hat{j} + \hat{k}, \vec{b} = \hat{i} - \hat{j} + \hat{k}, \vec{c} = \hat{i} + 2\hat{j} - \hat{k}$$

4. Show that each of the following triads of vectors are coplanar:

$$(i) \vec{a} = \hat{i} + 2\hat{j} - \hat{k}, \vec{b} = 3\hat{i} + 2\hat{j} + 7\hat{k}, \vec{c} = 5\hat{i} + 6\hat{j} + 5\hat{k}$$

$$(ii) \vec{a} = -4\hat{i} - 6\hat{j} - 2\hat{k}, \vec{b} = -\hat{i} + 4\hat{j} + 3\hat{k}, \vec{c} = -8\hat{i} - \hat{j} + 3\hat{k}$$

$$(iii) \vec{a} = \hat{i} - 2\hat{j} + 3\hat{k}, \vec{b} = -2\hat{i} + 3\hat{j} - 4\hat{k}, \vec{c} = \hat{i} - 3\hat{j} + 5\hat{k}$$

5. Find the value of λ so that the following vectors are coplanar:

$$(i) \vec{a} = \hat{i} - \hat{j} + \hat{k}, \vec{b} = 2\hat{i} + \hat{j} - \hat{k}, \vec{c} = \lambda\hat{i} - \hat{j} + \lambda\hat{k}$$

$$(ii) \vec{a} = 2\hat{i} - \hat{j} + \hat{k}, \vec{b} = \hat{i} + 2\hat{j} - 3\hat{k}, \vec{c} = \lambda\hat{i} + \lambda\hat{j} + 5\hat{k}$$

$$(iii) \vec{a} = \hat{i} + 2\hat{j} - 3\hat{k}, \vec{b} = 3\hat{i} + \lambda\hat{j} + \hat{k}, \vec{c} = \hat{i} + 2\hat{j} + 2\hat{k}$$

$$(iv) \vec{a} = \hat{i} + 3\hat{j}, \vec{b} = 5\hat{k}, \vec{c} = \lambda\hat{i} - \hat{j}$$

6. Show that four points whose position vectors are $6\hat{i} - 7\hat{j}, 16\hat{i} - 19\hat{j} - 4\hat{k}, 3\hat{i} - 6\hat{k}, 2\hat{i} - 5\hat{j} + 10\hat{k}$ are not coplanar.
7. Show that the points $A(-1, 4, -3), B(3, 2, -5), C(-3, 8, -5)$ and $D(-3, 2, 1)$ are coplanar.
8. Show that four points whose position vectors are $6\hat{i} - 7\hat{j}, 16\hat{i} - 19\hat{j} - 4\hat{k}, 3\hat{i} - 6\hat{k}, 2\hat{i} - 5\hat{j} + 10\hat{k}$ are coplanar. [CBSE 2014]
9. Find the value of λ for which the four points with position vectors $-\hat{j} - \hat{k}, 4\hat{i} + 5\hat{j} + \lambda\hat{k}, 3\hat{i} + 9\hat{j} + 4\hat{k}$ and $-4\hat{i} + 4\hat{j} + 4\hat{k}$ are coplanar.

BASED ON LOTS

10. Prove that: $(\vec{a} - \vec{b}) \cdot \{(\vec{b} - \vec{c}) \times (\vec{c} - \vec{a})\} = 0$
11. \vec{a}, \vec{b} and \vec{c} are the position vectors of points A, B and C respectively, prove that: $\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}$ is a vector perpendicular to the plane of triangle ABC .
12. Let $\vec{a} = \hat{i} + \hat{j} + \hat{k}, \vec{b} = \hat{i}$ and $\vec{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$. Then,
 (i) If $c_1 = 1$ and $c_2 = 2$, find c_3 which makes \vec{a}, \vec{b} , and \vec{c} coplanar.
 (ii) If $c_2 = -1$ and $c_3 = 1$, show that no value of c_1 can make \vec{a}, \vec{b} and \vec{c} coplanar. [CBSE 2017]
13. Find λ for which the points $A(3, 2, 1), B(4, \lambda, 5), C(4, 2, -2)$ and $D(6, 5, -1)$ are coplanar. [CBSE 2019]
14. If four points A, B, C and D with position vectors $4\hat{i} + 3\hat{j} + 3\hat{k}, 5\hat{i} + \lambda\hat{j} + 7\hat{k}, 5\hat{i} + 3\hat{j}$ and $7\hat{i} + 6\hat{j} + \hat{k}$ respectively are coplanar, then find the value of λ . [CBSE 2017]
15. Find the volume of the parallelepiped whose adjacent edges are represented by $2\vec{a}, -\vec{b}$ and $3\vec{c}$, where $\vec{a} = \hat{i} - \hat{j} + 2\hat{k}, \vec{b} = 3\hat{i} + 4\hat{j} - 5\hat{k}$ and $\vec{c} = 2\hat{i} - \hat{j} + 3\hat{k}$. [CBSE 2020]

HINTS TO SELECTED PROBLEMS

11. In order to prove the desired result, it is sufficient to prove that the vector

$\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}$ is perpendicular to each of the vectors \vec{AB}, \vec{BC} and \vec{CA} .

$$\text{i.e. } (\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}) \cdot \vec{AB} = 0, (\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}) \cdot \vec{BC} = 0,$$

$$\text{and, } (\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}) \cdot \vec{CA} = 0.$$

15. Volume = $|\begin{vmatrix} 2\vec{a} & -\vec{b} & 3\vec{c} \end{vmatrix}| = |-6 \begin{vmatrix} \vec{a} & \vec{b} & \vec{c} \end{vmatrix}| = 6 \begin{vmatrix} \vec{a} & \vec{b} & \vec{c} \end{vmatrix}|$

FILL IN THE BLANKS TYPE QUESTIONS (FBQs)

- $[\hat{i} \hat{k} \hat{j}] + [\hat{k} \hat{j} \hat{i}] + [\hat{j} \hat{k} \hat{i}] = \dots\dots\dots$
- If $\vec{a}, \vec{b}, \vec{c}$ are three vectors such that $[\vec{a} \vec{b} \vec{c}] = 10$, then $[\vec{a} + \vec{b} \vec{b} + \vec{c} \vec{c} + \vec{a}] = \dots\dots\dots$
- If $\vec{a}, \vec{b}, \vec{c}$ are non-coplanar vectors, then $\frac{(\vec{b} \times \vec{c}) \cdot (\vec{a} + \vec{b} + \vec{c})}{[\vec{a} \vec{b} \vec{c}]} = \dots\dots\dots$
- For any three vectors $\vec{a}, \vec{b}, \vec{c}$, the value of $\vec{a} \cdot \{(\vec{b} + \vec{c}) \times (\vec{a} + \vec{b} + \vec{c})\}$ is $\dots\dots\dots$
- The value of $[\vec{a} - \vec{b} \vec{b} - \vec{c} \vec{c} - \vec{a}]$, where $|\vec{a}| = 1, |\vec{b}| = 5$ and $|\vec{c}| = 3$, is $\dots\dots\dots$
- For any two vectors $[\vec{a} \vec{b} \vec{a} \times \vec{b}] + (\vec{a} \cdot \vec{b}) = \dots\dots\dots$
- If non-coplanar vectors $\vec{a}, \vec{b}, \vec{c}$ form a parallelepiped of volume 6 cubic units, then the values of $[\vec{a} + \vec{b} \vec{b} + \vec{c} \vec{c} + \vec{a}]$ are $\dots\dots\dots$
- If three non-coplanar vectors $\vec{a}, \vec{b}, \vec{c}$ form a parallelepiped of volume 8 cubic units, then the values of $[3\vec{a} \ 4\vec{b} \ 5\vec{c}]$ are $\dots\dots\dots$
- If $\vec{a}, \vec{b}, \vec{c}$ are non-coplanar vectors, then vectors $\vec{a} - \vec{b}, \vec{b} - \vec{c}$ and $\vec{c} - \vec{a}$ form a parallelepiped whose volume is $\dots\dots\dots$
- Let $\vec{a}, \vec{b}, \vec{c}$ be three non-coplanar vectors such that $[\vec{a} \vec{b} \vec{c}] = 24$ and $|\vec{a} \times \vec{b}| = 6$. Then the height of the parallelepiped formed by $\vec{a}, \vec{b}, \vec{c}$ with \vec{a} and \vec{b} as two adjacent edges of the base, is $\dots\dots\dots$
- If $\vec{r} \cdot \vec{a} = 0, \vec{r} \cdot \vec{b} = 0$ and $\vec{r} \cdot \vec{c} = 0$ for some non-zero vector \vec{r} , then the value of $\vec{a} \cdot (\vec{b} \times \vec{c})$ is $\dots\dots\dots$

| 6. $ \vec{a} ^2 \vec{b} ^2$ | 7. ± 12 | 8. ± 480 | 9. 0 | 10. 4 11. 0 |

VERY SHORT ANSWER TYPE QUESTIONS (VSAQs)

Answer each of the following questions in one word or one sentence or as per exact requirement of the question:

- Write the value of $[2\hat{i} \ 3\hat{j} \ 4\hat{k}]$.
- Write the value of $[\hat{i} + \hat{j} \ \hat{j} + \hat{k} \ \hat{k} + \hat{i}]$
- Write the value of $[\hat{i} - \hat{j} \ \hat{j} - \hat{k} \ \hat{k} - \hat{i}]$.
- Find the values of 'a' for which the vectors $\vec{\alpha} = \hat{i} + 2\hat{j} + \hat{k}$, $\vec{\beta} = a\hat{i} + \hat{j} + 2\hat{k}$ and $\vec{\gamma} = \hat{i} + 2\hat{j} + a\hat{k}$ are coplanar.
- Find the volume of the parallelepiped with its edges represented by the vectors $\hat{i} + \hat{j}$, $\hat{i} + 2\hat{j}$ and $\hat{i} + \hat{j} + \pi\hat{k}$.

6. If \vec{a}, \vec{b} are non-collinear vectors, then find the value of $[\vec{a} \ \vec{b} \ \hat{i}] \hat{i} + [\vec{a} \ \vec{b} \ \hat{j}] \hat{j} + [\vec{a} \ \vec{b} \ \hat{k}] \hat{k}$.
7. If the vectors $(\sec^2 A) \hat{i} + \hat{j} + \hat{k}$, $\hat{i} + (\sec^2 B) \hat{j} + \hat{k}$, $\hat{i} + \hat{j} + (\sec^2 C) \hat{k}$ are coplanar, then find the value of $\operatorname{cosec}^2 A + \operatorname{cosec}^2 B + \operatorname{cosec}^2 C$.
8. For any two vectors \vec{a} and \vec{b} of magnitudes 3 and 4 respectively, write the value of $[\vec{a} \ \vec{b} \ \vec{a} \times \vec{b}] + (\vec{a} \cdot \vec{b})^2$.
9. If $[3\vec{a} + 7\vec{b} \ \vec{c} \ \vec{d}] = \lambda [\vec{a} \ \vec{c} \ \vec{d}] + \mu [\vec{b} \ \vec{c} \ \vec{d}]$, then find the value of $\lambda + \mu$.
10. If $\vec{a}, \vec{b}, \vec{c}$ are non-coplanar vectors, then find the value of $\frac{\vec{a} \cdot (\vec{b} \times \vec{c})}{(\vec{c} \times \vec{a}) \cdot \vec{b}} + \frac{\vec{b} \cdot (\vec{a} \times \vec{c})}{\vec{c} \cdot (\vec{a} \times \vec{b})}$.
11. Find $\vec{a} \cdot (\vec{b} \times \vec{c})$, if $\vec{a} = 2\hat{i} + \hat{j} + 3\hat{k}$, $\vec{b} = -\hat{i} + 2\hat{j} + \hat{k}$ and $\vec{c} = 3\hat{i} + \hat{j} + 2\hat{k}$. [CBSE 2014]

ANSWERS

1. 24 2. 2 3. 0 4. $a = 1, \frac{1}{2}$ 5. π cubic units 6. $\vec{a} \times \vec{b}$
7. 2 8. 144 9. 10 10. 0
